'tapir
June 2nd, 2020 - A tapir is a large herbivorous mammal similar in shape to a pig with a short prehensile nose. Tapirs inhabit jungle and forest regions of South America, Central America, and Southeast Asia. There are four widely recognized extant species of the five species of tapirs living in the world today.

May 27th, 2020 - It is regarded as the largest living native terrestrial mammal. The size of the tapir, excluding the tail, varies between 5.9 and 8.2 feet. The animal has a dark brown body and paler face. Younger tapirs have white spots or stripes on the brown coat. The round ears of the tapir have distinctive white edges.

April 26th, 2017 - Lowland tapir (Tapirus terrestris) also known as South American tapir and Brazilian tapir found in tropical South America. Baird's tapir (Tapirus bairdii) found in Central America and the north-west of South America. Mountain tapir (Tapirus pinchaque) found in the north-west of South America. Malay tapir (T. indicus) found in South East Asia. In 2013, a new species of tapir was announced.

May 30th, 2020 - The tapir can use its flexible nose to explore a circle of ground 1 foot 30 centimeters in diameter without having to move its head. The better to smell you with the small trunk of a tapir makes for a good snorkel underwater too. In the wild, tapirs eat a variety of different plants.

June 2nd, 2020 - Tapirs are a living fossil; they have been around since the Eocene having survived waves of extinction of other animals. They are South America's largest native land mammal, with adults ranging in size from 300 to 700 pounds. A tapir's most notable feature is its unique prehensile nose.

June 2nd, 2020 - Tapirs are often confused with other large mammals such as hippos, pigs, or anteaters, but according to media reports, their closest living relatives are actually rhinoceroses and horses. According to the Tapir Specialist Group, an organization that works to conserve their habitat, tapirs are living fossils.

June 1st, 2020 - The Sungai Dusun Wildlife Conservation Centre in Northern Selangor is home to a number of Malayan tapirs and some gharial crocodiles. The conservation centre was first established in 1964 with a 4500 hectare area for the protection and conservation of Sumatran rhinos. A few of which roamed wild in peninsular Malaysia until displaced by encroaching plantation activity or killed by poachers.

Today is World Tapir Day. 10 Things You May Not Know About May 29th, 2020 - Tapirs have prehensile noses are essential for forests' health and are an umbrella species. Here are some curious facts about this ancient animal.

May 8th, 2020 - Allow me to introduce myself. I'm a tapir where you'll most likely find me wooded jungles or grassy areas in Central and South America as well as Southeast Asia. What I like to eat: plants, leaves, twigs, berries, fruit, and grass. Betcha didn't know this about me. Female tapirs have their babies one per pregnancy while standing up. Our babies are born with their own camouflage brown fur.

On World Tapir Day a quick look at part of tapir history.

June 1st, 2020 - On World Tapir Day a quick look at would have been significantly larger than any living American tapirs and more similar in size to climate change threatens the ancient wild rice traditions.

Endangered Tapirs Thriving on Former Drug Cartel Ranch December 31st, 2019 - Almendra is one of 10 tapirs living in a 12 hectare natural area alongside a giraffe called Big Boy. Two African lions, four Bengal tigers, and four hippopotamuses. Pumas, jaguars, camels, zebras, ostriches are among the 500 animals from 48 species that live there.

Tapir Britannica May 31st, 2020 - Tapir genus Tapirus any of five species of hoofed mammals the only extant members of the family Tapiridae. Order Perissodactyla found in tropical forests of Malaysia and the New World. Heavy bodied and rather short legged tapirs are 1.3 to 2.5 metres about 4 to 8 feet long and reach about 1 metre at the shoulder. The eyes are small, the ears are short and...
The Endangered Malayan Tapir Tapirus Indicus Facts And

June 2nd, 2020 - The Malayan Tapir is the largest species of tapir and has the longest proboscis. The animal is also known as the Asian Tapir. Its scientific name is Tapirus Indicus. The animal has a distinctive black and white pattern on its body.

May 9th, 2020 - Tapirs are excellent swimmers and are mammals they are herbivores and in the wild their average lifespan is about 25 to 30 years as being a mammal they give birth to live young and the gestation takes around 13 months giving birth to one calf at a time.

May 19th, 2020 - The Malayan Tapir once wandered the tropical timberlands crosswise over South East Asia. Yet the Malayan Tapir today has a much littler run fundamentally because of living space misfortune. The mountain tapir is the most modest of the four diverse tapir species and as the name prescribes it occupies a greater number of sloping areas as opposed to marsh woods.
